

Azure Guide for CS224n

This guide will help you setup and use Azure Virtual Machines for your final project. Before we start, it cannot be stressed enough: **do not leave your machine running when you are not using it**. The expected time to complete the setup guide is **15 min** to **1 hour**, depending on which configuration you opt to take.

Your Azure subscription for this class

Microsoft has generously agreed to sponsor CS224n, and has provided us with Azure credit to distribute to CS224n students. We expect that there will be enough credit for teams to run as many experiments as they need for their projects. **However, it's very important for students to manage their credit carefully, so that they can get the most out of it (see next section).**

You should receive an email on Tuesday or Wednesday (Feb 13/14) with an invitation to claim your initial Azure credit of **\$150**. Credit has been assigned per team (according to the teams you gave us in your project proposal), with the same amount allocated regardless of team size. The \$150 corresponds to about **126 hours**, or slightly over **5 days** on a NV6 machine.

The \$150 is an initial allocation. If you use it up running *genuine* experiments, that's **perfectly OK and completely expected** – we expect that most teams will need more credit, and we have plenty more to give you. However, please don't use up your credit by leaving your machine running when you're not using it! Nor should you use up many hours of credit using your VM to write your code (see next section).

When you run out of credit (or before you run out), you can ask us for more on Piazza using the "azure" tag.

Best practices for managing your Azure credit

Azure virtual machines are charged at a flat rate, for each minute that they are turned on.

This is irrespective of:

- whether you are ssh'd to the machine at that time
- whether you are running any processes on the machine at that time
- the computational intensity of the the processes you're running
- whether you're using GPUs

Therefore, the most important thing you need to do to, to manage your Azure credit, is to **carefully turn your VM on and off just when you need it**. If you are using a NV6 VM, it is charged at \$855.60/month (i.e., approximately **\$1.19/hour**) while it is turned on.

We advise you to **develop your code on your local machine** (for example your laptop with the CPU version of TensorFlow installed) for debugging (i.e., work on your new code until you are able to complete several training iterations without errors), then run your code on your Azure VM when it's time to train on a GPU.

*Note: we have provided you with a [Practical Tips for Final Projects](#) document which gives tips on how to sync your code between your laptop and your VM, how to use *tmux* to manage your sessions in your VM, and how to monitor your memory/CPU/GPU usage.*

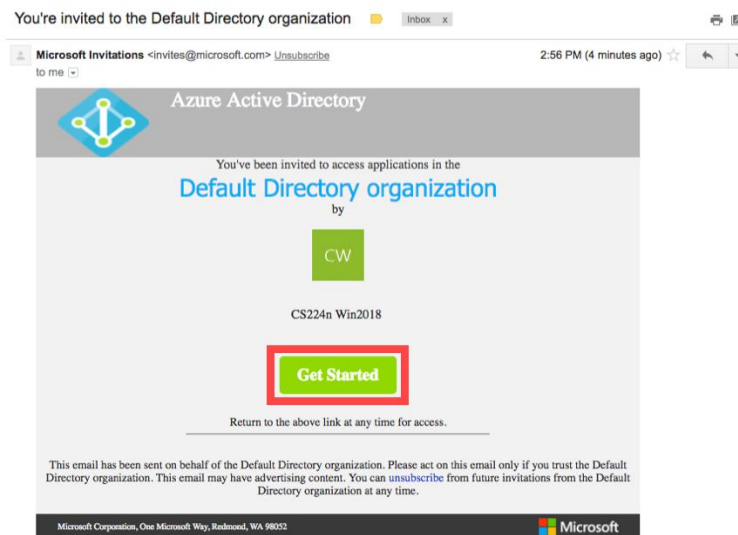

Azure also has an [auto-shutdown feature](#) that allows you to specify a time when you want your VM to turn off - this allows you to turn off the machine at a time when you are unable to do it manually. For example, if you start an experiment at 9 p.m., and you want to stop it after 5 hours, you can set auto-shutdown to turn your VM off at 2 a.m. This will prevent you spending credit that you would have otherwise spent until you woke up many hours later to turn off the VM.

See FAQs of this document to learn how to check your balance.

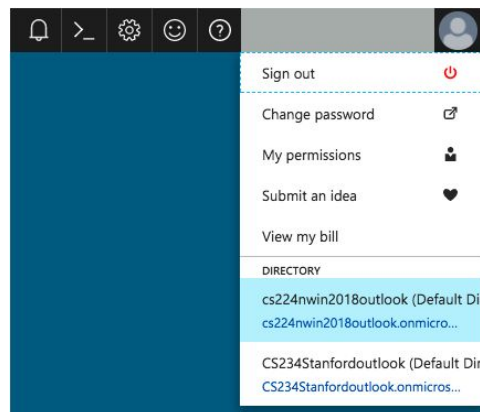

Configuring your Azure VM

Creating an Azure account (5 min)

You should have received an email with an invitation to join a subscription. Click Get Started and follow the instructions, using the email account that received this invitation. After completing the instructions, you will be redirected to your dashboard; if not, you can login to your account at portal.azure.com.

If you have multiple subscriptions (e.g. you're sharing the same email account for CS 224N with another course using Azure like CS 234 or CS 273B), then you must select CS 224N in the Account Menu in the top-right corner.

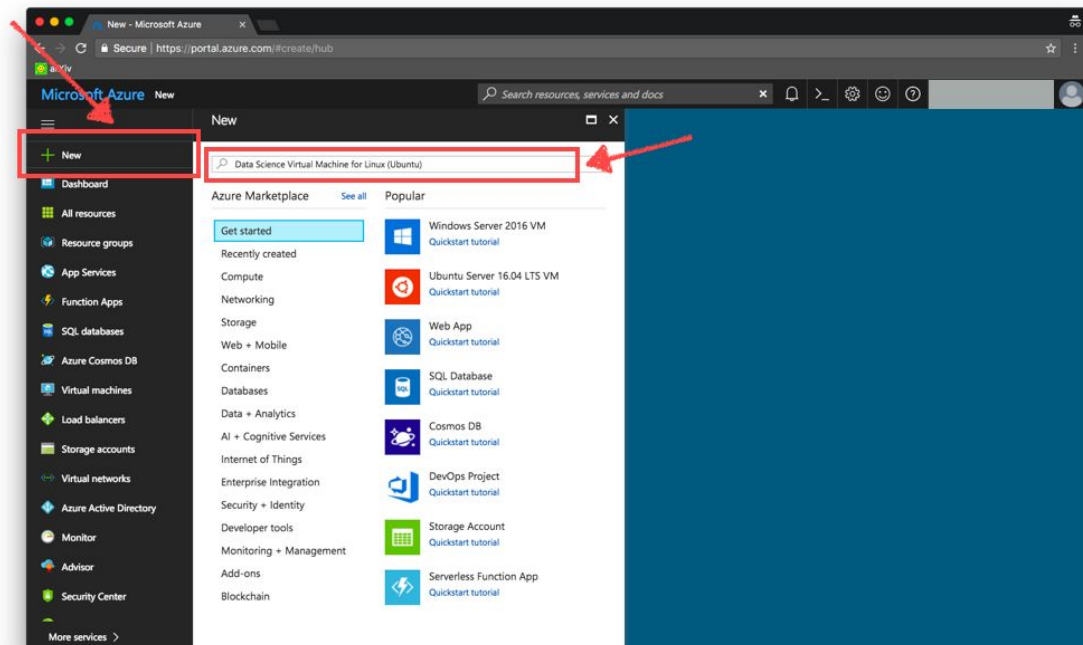

Creating a VM (15-45 min)

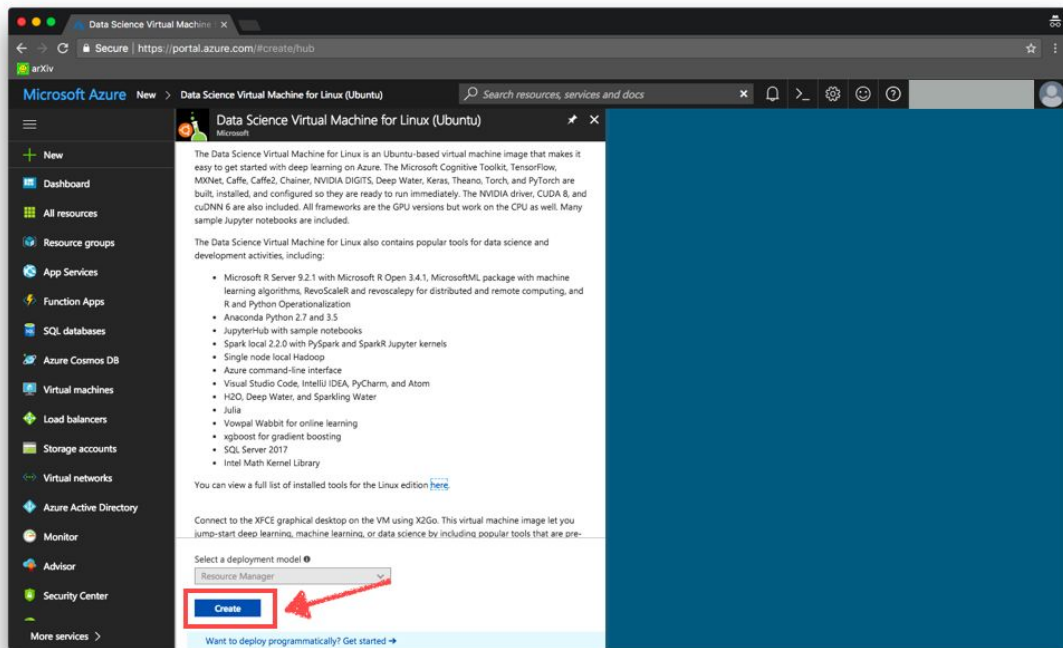

Using a predefined image (15 min)

If you use a predefined image, we recommend using the **Data Science Virtual Machine for Linux (Ubuntu)** image, which comes installed with Python 3.5, tensorflow-gpu, CUDA, and cuDNN.

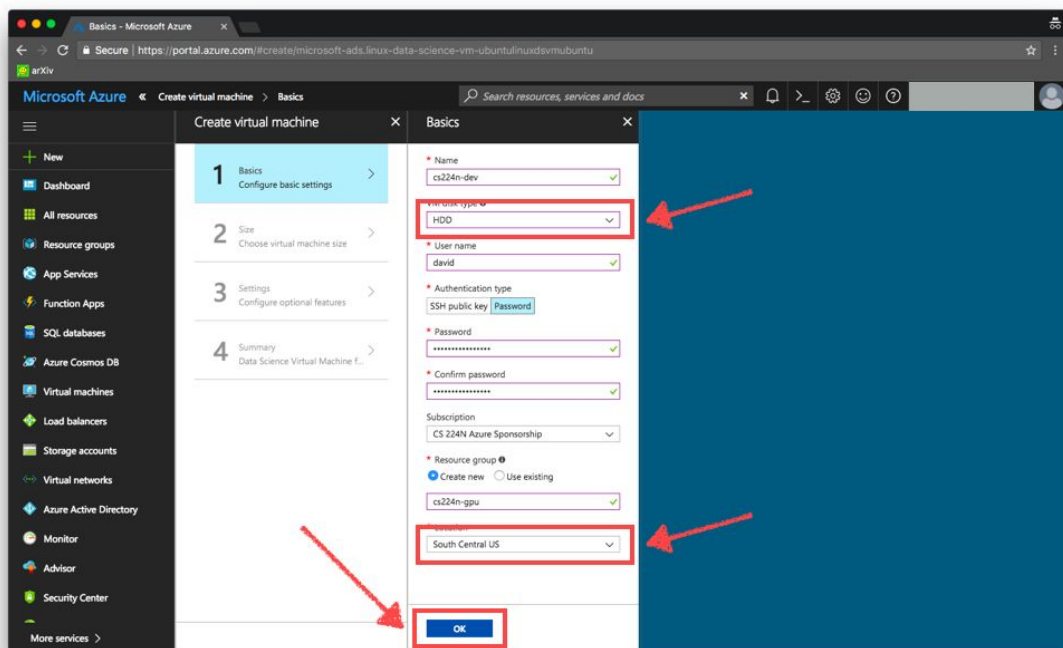

1. Click the **+** in the left sidebar menu and type in **Data Science Virtual Machine for Linux (Ubuntu)**. It's essential that you select the Ubuntu and **not** CentOS distribution.

2. Click **Create**.

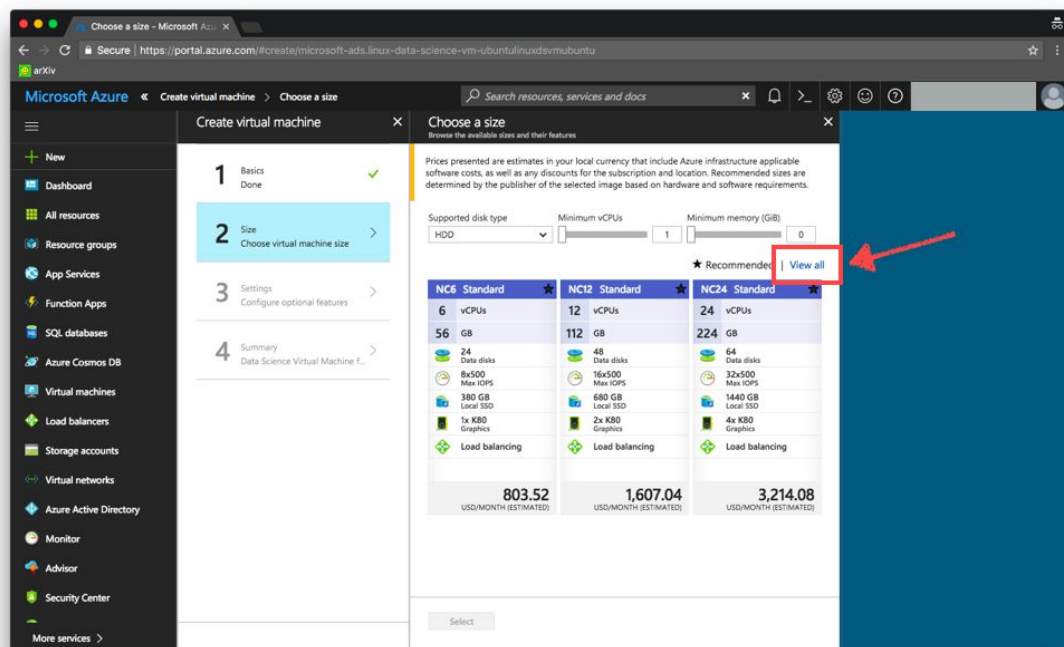

3. Fill in the the following fields ... Then click **OK**.

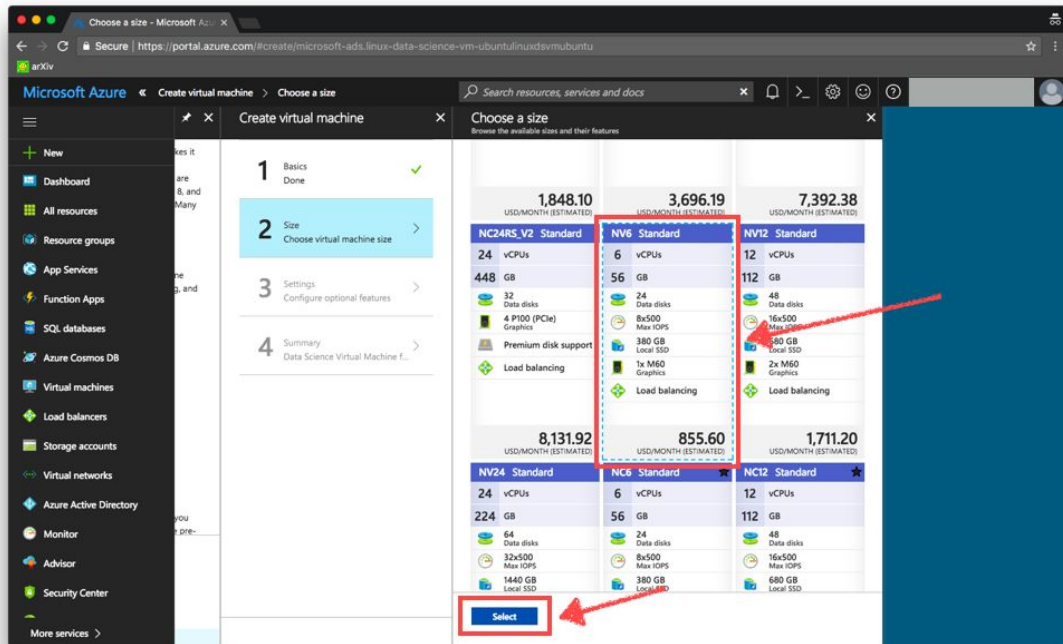

- **Name.** This will be the name of your VM. You can name it whatever you want. I named mine **cs224-dev**.
- **VM disk type.** You **must** select **HDD**; otherwise future steps will not be correct.

- **User name.** This will be the username used on the VM. You can name yourself whatever you want. I named myself `david`. Since it's most convenient for all of the people in your group to share one user account, it might make more sense to use the name `group` or `team` or `<team-name>` like `purple-elephants`. (I bet your favorite language model didn't expect to see purple elephants in an Azure walkthrough...)
- **Authentication type.** If you are not familiar with SSH keys, authenticate using password; otherwise, choose whichever you prefer. I chose a secret password.
- **Subscription.** Choose the only available option. If there are multiple options or none, post on Piazza for additional assistance.
- **Resource group.** If you create multiple VMs, those within the same resource group will share resources. Unless you create multiple VMs, this configuration does not matter, so click `Create New` and type `cs224n-gpu`.
- **Location.** You **must** select `South Central US` for Location; otherwise, there might not be any GPUs available to you at the next step.

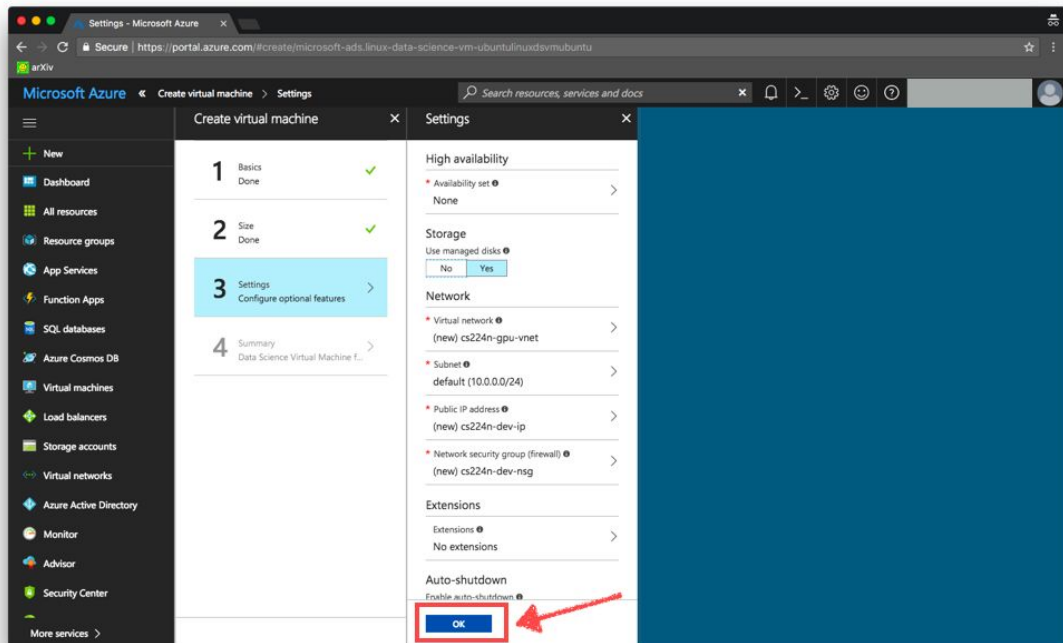

4. Click `View all`.

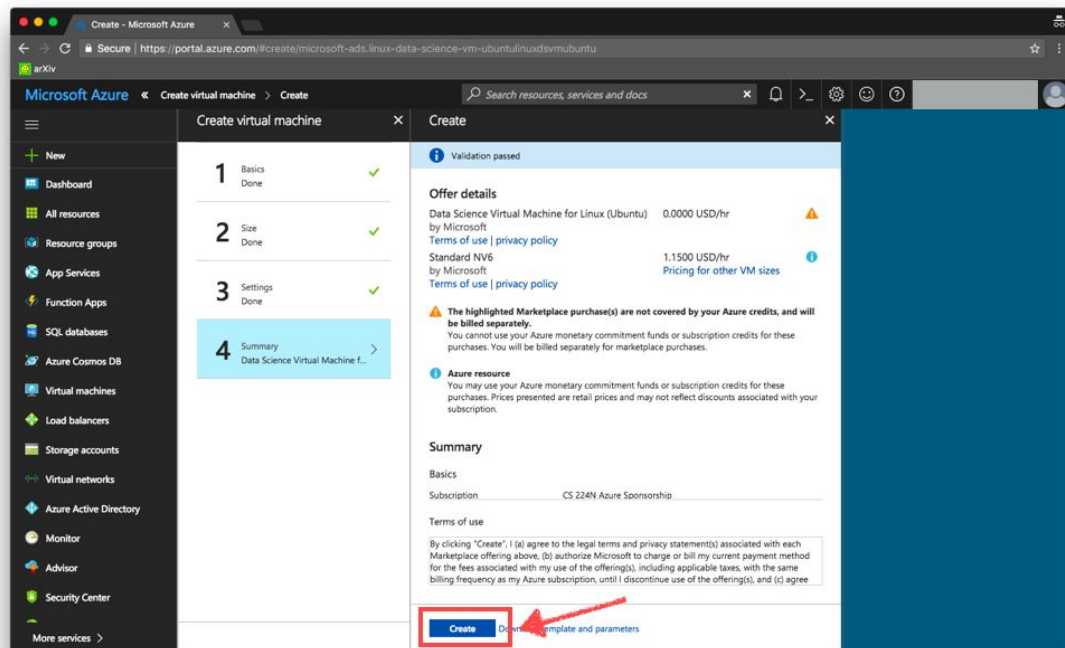

5. Select **NV6 Standard**. (If you don't see this option, you probably didn't select **HDD** or **South Central US** in Step 3.) Click **Select**.

6. Accept the default configuration. Click **OK**.

7. Wait for the configuration to validate. Click **Create**.

8. You've created a VM! Continue to [Using Azure](#).

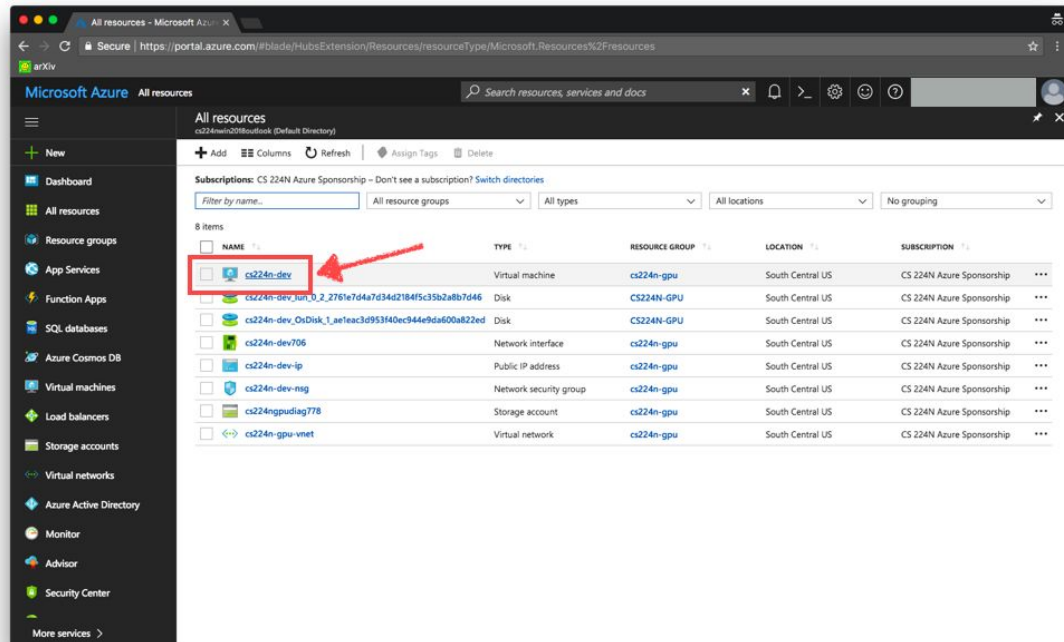

Using Azure

Managing a VM

1. Click the **All resources** in the left sidebar menu.

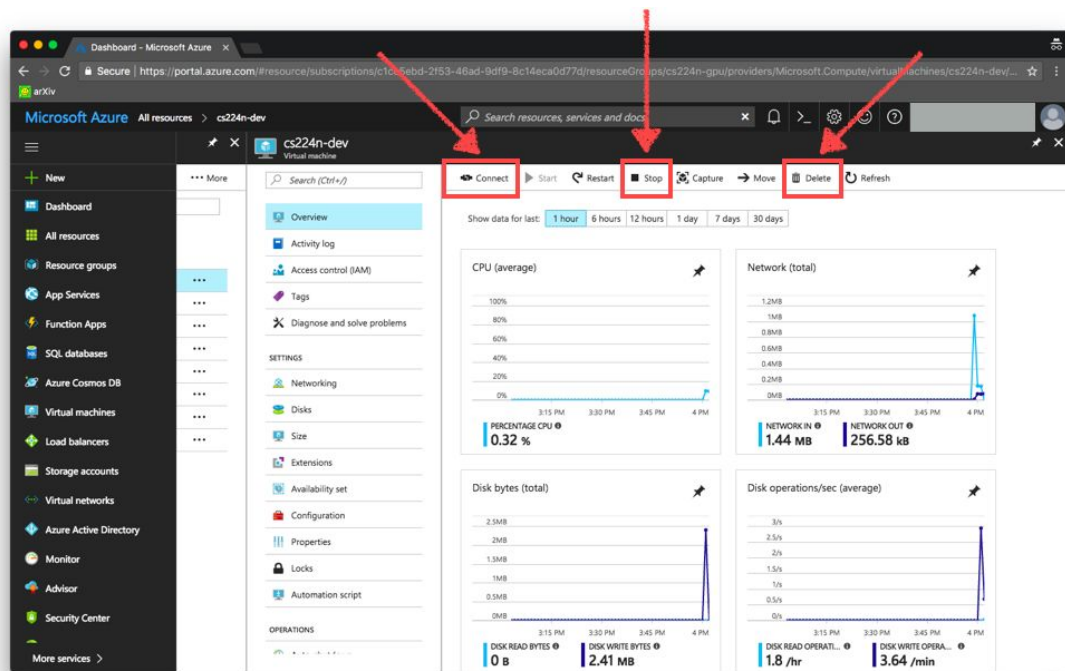

2. Click the name of your VM. You might need to wait up to 10 minutes after creating the VM for it to appear on this menu.

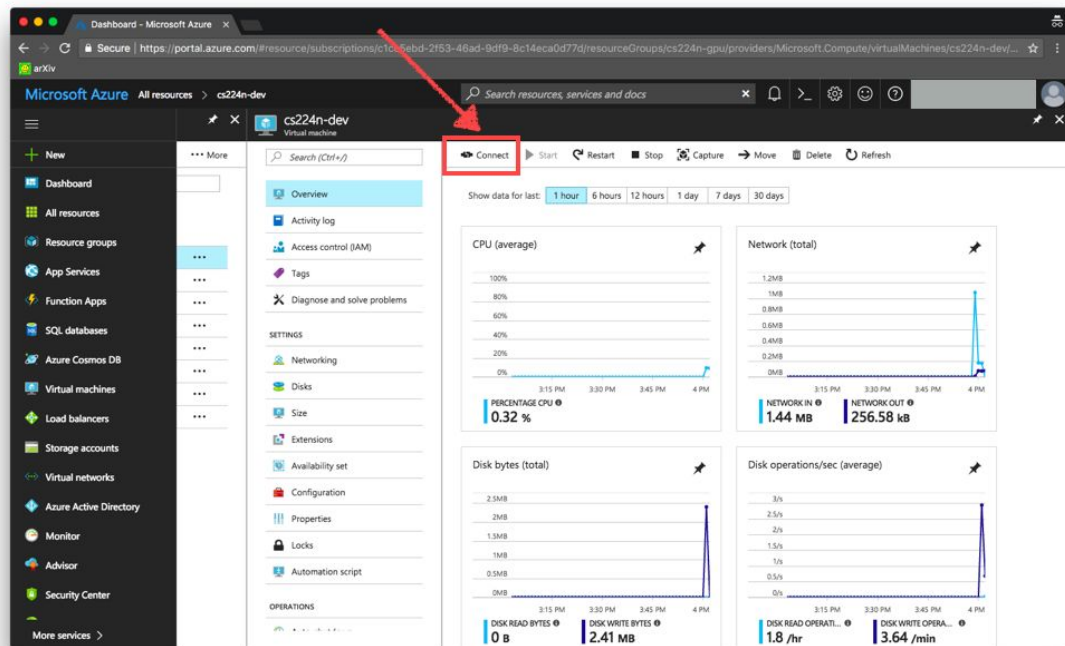

3. There are a few important options. Click **Connect** for an ssh command to connect to your instance. Click **Start/Stop** to start or stop the instance. If you want to delete the instance, click **Delete**.

*Note that if your instance is stopped but not deleted, it will still accrue charge for storage. (This cost is somewhat minimal.) If your instanced is not stopped or deleted, it will accrue charge for storage and VM. Again, **do not leave your machine running when you are not using it.***

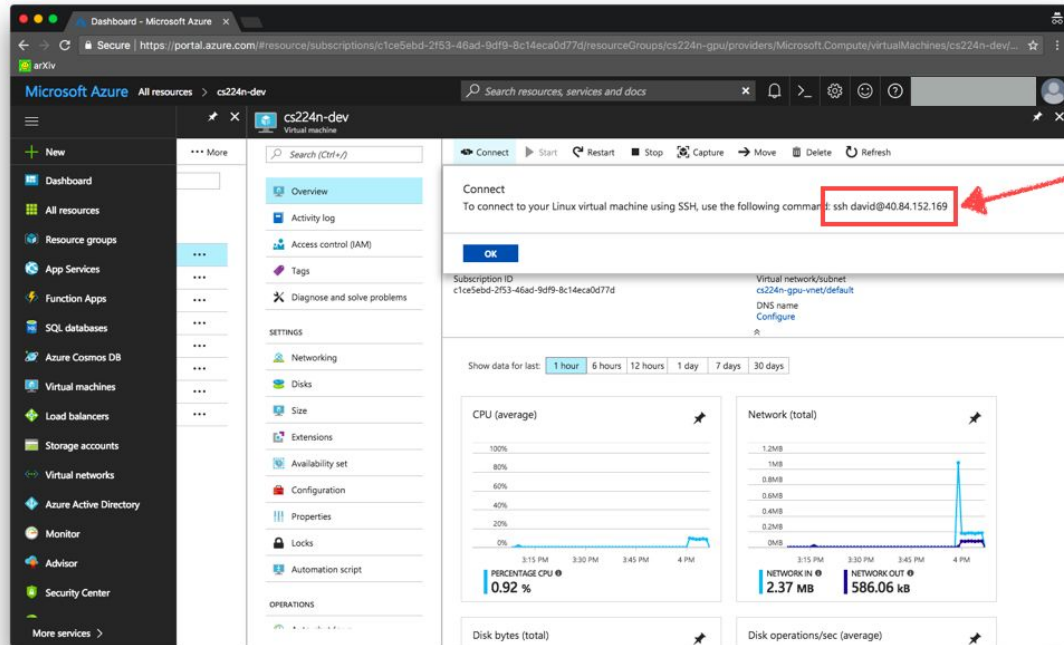

Connecting to a VM

1. Click **Connect** from the previous menu.

2. Copy and paste the command into your terminal.

```
david at air in ~
$ ssh david@40.84.152.169
The authenticity of host '40.84.152.169 (40.84.152.169)' can't be established.
ECDSA key fingerprint is SHA256:xSxPkPHQ2ANCPp94eSdnS6FILEb4HZ3m6lgZcQQKDs.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '40.84.152.169' (ECDSA) to the list of known hosts.
david@40.84.152.169's password:
Welcome to Ubuntu 16.04.3 LTS (GNU/Linux 4.13.0-1005-azure x86_64)

1 package can be updated.
0 updates are security updates.

The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

*****
* Welcome to the Linux Data Science Virtual Machine on Azure!
*
* For more information on available tools and features,
* visit http://aka.ms/dsvm/discover.
*****

To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

david@cs224n-dev:~$
```

3. Check that Tensorflow can access the GPUs by opening Python and typing the following:

```
import tensorflow as tf
```

```
sess = tf.Session(config=tf.ConfigProto(log_device_placement=True))
```

You should see something like this:

```
david@cs224n-dev:~$ python
Python 3.5.2 |Anaconda custom (64-bit)| (default, Jul 2 2016, 17:53:06)
[GCC 4.4.7 20120313 (Red Hat 4.4.7-1)] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> import tensorflow as tf
>>> sess = tf.Session(config=tf.ConfigProto(log_device_placement=True))
2018-01-16 00:19:38.203191: I tensorflow/core/platform/cpu_feature_guard.cc:137] Your CPU supports instructions that this TensorFlow binary was not compiled to use: SSE4.1 SSE4.2 AVX AVX2 FMA

FAQs

How do I check my remaining balance?

Go to <https://www.microsoftazuresponsorships.com/manage>. Note that Azure bills at midnight every business day, so this figure usually reflects your credit as of the last billing time.

How do I share my instances with other students in my group?

Once an instance and user account on that instance has been created using a subscription, all accounts linked to that subscription can see that instance on their dashboard and follow the directions in Using Azure to manage and connect to their VM.

How do I create new user accounts?

If your group feels strongly about using separate user accounts instead of a shared one on your instance, please post privately on Piazza. (I thought those instructions were somewhat superfluous since I couldn't think of a reason any groups would need this functionality.)

What happens when I exceed my credit?

Azure bills at midnight every business day. So if, at midnight on a business day, you have exceeded your credit, Azure will turn off your VM. Note that at this point, your account may be in debt. If/when this happens to you, let us know on Piazza and tag your post with the "azure" tag.

Can I add a personal credit card to the account?

Sure, though we do not recommend it. If you exhaust the funds from your CS 224N subscription, your personal credit card will be charged without warning.

Can I select more powerful instances?

Though we recommend the NV6, you are free to use any of the instances. Just keep in mind that you have a budget!
